Gender inequality and the COVID-19 crisis: A Human Development perspective¹

The COVID-19 crisis is a systemic human development crisis, compounding risks to progress towards gender equality. The pandemic and its consequences hit a world wealthier than ever but facing deep divides in human development². Some of the consequences of COVID-19 have had a greater impact on some countries and groups within countries, as pre-existing horizontal inequalities can magnify the effects of the crisis. Across several social, economic, and political dimensions, women and girls are disproportionately affected by the crisis simply because of their sex. The immediate effects of COVID-19 on gender inequality are already showing themselves in health and education, on the burden of unpaid care work and gender-based violence.

While the COVID-19 crisis affects everyone, women and girls face specific and often disproportionate economic, health, and social risks due to deeply entrenched inequalities, social norms, and unequal power relations. Understanding the gender-differentiated impacts of the COVID-19 crisis through sexdisaggregated data is fundamental to designing policy responses that reduce vulnerable conditions and strengthen women's agency, placing gender equality at their centre. This is not just about rectifying longstanding inequalities but also about building a more just and resilient world3.

This paper presents a justification for the selection of indicators for the two dashboards, based on a comprehensive literature review, which give an overview of gender inequalities from the COVID-19 crisis that puts capabilities at risk as well as women's ability to face the effects of the pandemic and economic crisis. The first dashboard covers a set of indicators on capabilities at risk. The second dashboard depicts a series of measures of safe space, balanced care work, and the agency of women and girls.

Dashboard 1: Crisis and capabilities at risk

The first dashboard (figure 1) presents the gender development index as a compound measure of the gender gaps in human development at the country level. The first set of indicators of the dashboard points to women's health and risk factors in the face of the COVID-19 pandemic by examining women's presence in the health sector, access to sexual and reproductive health, and their risk of underlying cardiovascular conditions. The second set of indicators explores women's economic capabilities, identifying their presence in the formal and informal economy. The health and economic dimensions are grouped together as women are at the frontlines of the crisis response in both of them.

DASHBOARD 1 **CRISIS AND CAPABILITIES** AT RISK Share of Share of informal Gender employment in employment in Development nonagriculture nonagriculture Index (GDI) (female) (female) SDG 8.3 SDG 8.3 Medical Nursing personnel Mortality rate Maternal Adolescent doctors (female) attributed to birth rate prevelance, mortality (female) cardiovascular disease, any method ratio SDG 3.c SDG 3.7 cancer, diabetes or SDG 3.c **SDG 3.1** SDG 3.7, 5.6 chronic respiratory disease (female) **SDG 3.4**

Figure 1. Groupings and indicators in Dashboard 1

Source: Human Development Report Office.

Note: In the dashboard, for each indicator, countries are divided into five groups of roughly equal sizes. The intention is not to suggest thresholds or target values for the indicators, but to allow a crude visual assessment of a country's performance relative to others'. For example, a country that is in the top quintile group in an indicator performs better than 80 percent of countries in this indicator. Similarly, a country in the medium group performs better than 40 percent of countries but also worse than 40 percent of countries. Rankings are not provided in the dashboard. There is no index of crisis and capabilities at risk that can be used for the unique ordering or ranking of the countries. Details on the Human Development Index Ranking and the Gender Development Index see Human Development Report 2019 Statistical Annex at http://hdr.undp.org/en/data.

Women are in the frontlines of the COVID-19 response, putting them at a higher risk of exposure to the virus. They make up 70 percent of the workers in the health and social sector globally⁴ and constitute most health facility service-staff⁵. Across the very high, high, and medium human development groups, women make up more than 85% of nursing personnel, and women make up almost half of doctors for all counties except those with low human development (figure 2).

⁴ Boniol and others 2019

⁵ United Nations 2020.

Women's health is also adversely impacted by the reallocation of resources and priorities away from crucial areas such as sexual and reproductive health services⁶. This could lead to an increase in maternal mortality and morbidity, adolescent pregnancies, and HIV and sexually transmitted diseases. Previous health crises like the Ebola virus and the Zika virus outbreaks provided evidence to this effect7. Maternal mortality ratios reach 198 deaths per 100,000 live births in medium development countries and 557 deaths per 100,000 live births in low human development countries. Adolescent pregnancies are higher than 30 births per 1,000 women ages 15-19 for high and medium human development countries, and higher than 100 births per 1,000 women ages 15-19 for low human development countries. In reference to contraception, in medium and low human development countries, the percentage of married or in-union women of reproductive age that use contraception remains lower than 55 percent. If COVID19 lockdowns shut related services for 6 months, in low and middle-income countries, 47 million women are expected to lose regular access to modern contraceptives. In this same scenario, an additional 7 million unintended pregnancies are expected to occur⁸.

Regarding COVID 19 and risk groups link to diseases as well as possible biological differences in COVID-19 impact over men and women, there is still limited information. Men have been more affected by the virus both in contagion and mortality - but it is unclear whether this is due to biological, behavioral, or other reasons⁹. There is, however, the certainty that specific groups are more at risk. These include the elderly and people with underlying conditions such as heart disease, lung, and respiratory health, and diabetes, amongst others 10.

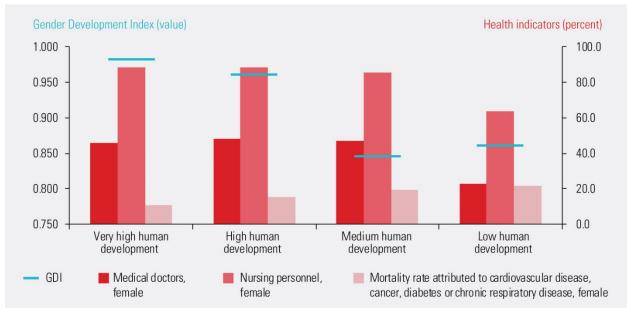

Figure 2. Women are in the frontlines of COVID-19 response and face significant health risks

Source: Human Development Report Office.

Note: Aggregation rule has been relaxed; some estimates not published in the dashboard. The Gender Development Index measures disparities on the HDI by gender formulated as the ratio of female to male HDI values. The closer the ratio is to 1, the smaller the gap between women and men. Details on the Human Development Groups and the Gender Development Index see Human Development Report 2019 Statistical Annex at http://hdr.undp.org/en/data.

Moreover, the pandemic's economic impacts that have left no country or population unscathed, and women are, again, disproportionately affected¹¹. Compared to men, women have less capacity to absorb economic

shocks because they have lower earnings, savings, and job security, and they are overrepresented in the informal sector: 740 million women worldwide, and over 70 percent of women in informal employment in developing economies (figure 3)¹² ¹³. Due to the nature of this work, women are less likely to have protection against dismissals, paid sick leave, and other worker rights if their employment is affected by the crisis. Other effects in the economic arena, such as unpaid care work will be presented in Dashboard 2.

In many countries, women are overrepresented in the accommodation and food services, real estate, administrative activities, manufacturing (notably the garment sector), and the wholesale/retail trade sectors. These have been identified as among the sectors to be most heavily impacted by the COVID-19 pandemic¹⁴. Moreover, many women in high-risk sectors own micro or small enterprises or are self-employed¹⁵. They are now facing increased risks of bankruptcy due to gaps in financing, which translate to women having less access to capital and loans: 80 percent of women-owned enterprises with credit needs are either unserved or underserved¹⁶.

Dashboard 2: Safe space, balanced care work and agency

The second dashboard (figure 4) presents the gender inequality index (GII) as a compound measure of gaps in empowerment faced by women and girls. It offers a first set of indicators regarding safe space at the household level, such as the prevalence of severe food insecurity, time spent on unpaid domestic and care work, child marriage, and intimate partner violence. The second set of indicators portrays women's agency in responding to the crisis through access to technology (internet and mobile phone), education, the share of women in senior and middle management, political participation, and access to social protection by oldage pension recipients.

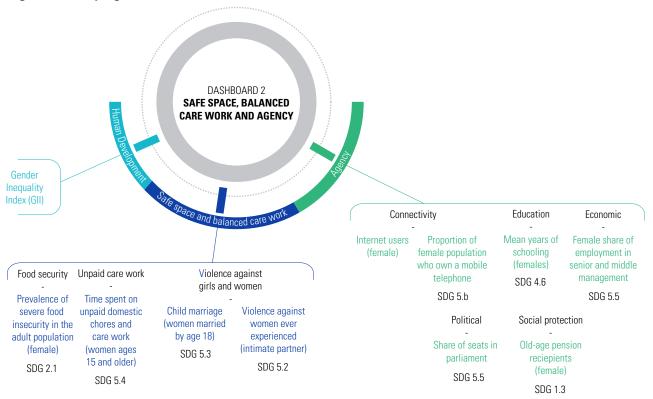

Figure 4. Groupings and indicators in Dashboard 2

Source: Human Development Report Office.

Note: In the dashboard, for each indicator, countries are divided into five groups of roughly equal sizes. The intention is not to suggest thresholds or target values for the indicators, but to allow a crude visual assessment of a country's performance relative to others'. For example, a country that is in the top quintile group in an indicator performs better than 80 percent of countries in this indicator. Similarly, a country in the medium group performs better than 40 percent of countries but also worse than 40 percent of countries. Old-age pension recipients (female) is an exception - countries are divided into three groups. Rankings are not provided in the dashboard. There is no index of safe space, balanced care work, and agency that can be used for unique ordering or ranking of the countries. Details on the Human Development Index Ranking and the Gender Inequality Index see Human Development Report 2019 Statistical Annex at http://hdr.undp.org/en/data.

Widespread lockdowns around the world mean many women are being asked to stay home and isolate in a space that is supposed to be safe, but many households are not prepared to provide this safety to women and girls. These measures have important implications over food security, the division of unpaid care work, and increased risks for gender-based violence. At the household level, gender inequalities can persist through a vicious cycle of powerlessness, often rooted in gender social norms that force women to face heavily restricted or even "tragic choices." ¹⁷

The pandemic is expected to double the number of people facing food crises¹⁸. It constitutes a risk, especially for women and girls, as in times of crisis, women tend to eat less to provide for children and other family members¹⁹. Regarding the division of unpaid care work, globally, women spend, on average, 3.2 more hours on unpaid care and domestic work than men²⁰. With quarantine measures, the workload in caring for children, the sick, and the elderly, as well as household tasks, will likely increase. Furthermore, the gradual reopening will pose additional challenges for women as it could push them out of the labor force or into part-time jobs while increasing their responsibilities at home, and this pressure intensifies for single mothers²¹.

Finally, 243 million women and girls worldwide have been subjected to sexual and/or physical violence by an intimate partner²². For countries in medium and low human development groups, the percentage of women who ever-experienced intimate partner violence is, on average greater than 30 percent (figure 5). Still, 30 percent of people believe it is justifiable for a man to beat his partner²³. Pre-existing toxic social norms, combined with increased economic and social stress caused by isolation measures and financial difficulties in the household, have driven an increase in gender-based violence as many women are in lockdown with their abusers²⁴, while services to support, survivors are being disrupted or inaccessible because of the pandemic. Child marriage is another manifestation of gender-based violence. Many of the factors that drive child marriage are exacerbated in crisis and emergency settings. Effects of the pandemic such as loss of household income, higher risk of violence in the household, and lack of access to schooling can increase child marriage²⁵. Harmful practices such as child marriage remain higher than 25 percent across high, medium, and low human development groups. All these issues accumulate across the life course and affect well-being and social security in old age.

An ability to deal with the effects of the pandemic is not only reflected at the household level but also through women's agency. Agency gives women the ability and freedom to make decisions over their own lives and bodies. During a crisis, agency constitutes a powerful tool for resilience and overcoming new barriers.

Education is a tool for women to expand their ability to make decisions and act on them, but the pandemic is affecting education globally. Given school closures and lockdowns, 10 million girls in secondary school could be out of school due to the crisis. The mean years of schooling for females in medium human development countries is 5, while for low human development countries barely reaches 4. The opportunity to continue the education remotely, from home, is essential. For many girls in low-income countries, access to education was already a challenge²⁷ before the outbreak. Across high, medium, and low human development countries, less than 60 percent of women use the internet. The average percentage of female internet users is less than 30 percent for countries with medium or low human development (figure 6). The closure of schools can widen the gender digital divide due to unequal access to the internet and technologies.

Furthermore, evidence from past crises has shown that school closures can lead to higher risks of sexual abuse and teenage pregnancies²⁸. Also, the consequences of the pandemic can constrain women's decision-making power in the economic and political spheres, leading to widening gender gaps in accessing basic services, controlling assets, and managing resources. The lack of women's participation in decisionmaking processes limits the reach and impact of recovery efforts and the possibilities to revitalize economies and societies. In high, medium, and low human development groups, the percentage of seats in the parliament held by women is less than 25 percent. Women were already advancing at a slow pace in getting representation in positions of power, at the economics and political spheres, the lockdown puts at risk the gains at the household level, hinders women participating in decision making and increases the risk of job losses.

Policy relevance of disaggregated data

Policies to reduce conditions of vulnerability and strengthen capacities to tackle crises are crucial to enable girls and women to better weather and recover from these shocks. Strong policy responses will be built from sex-disaggregated data that allows a better understanding of the gender implications of the COVID-19 crisis²⁹. There is an urgent need for more and better collection as well as reporting of data disaggregated by sex. Also, by age, residence (urban/rural), race, ethnicity, and other intersectional characteristics to inform policymakers, governments, decision-makers, and researchers, thus helping them better understand and respond to the pandemic.

Notes
 a. Data refer to the most recent year available during the period specified.
 b. Data are average annual estimates for 2015-2020.
 T. From original data source.

DEFINITIONS

DEFINITIONS

Gender Development Index (DDI): Ratio of female to male HDI values. See Technical node 3 at http://hdr.undp.org/sites/defaul/files/hd/2019_lechnical_notes.pdf for details on how the Gender Development Index is calculated.

Medical doctors, female: Female doctors as percentage of all medical doctors at national level.

Nursing personnel, female: Female nursing personnel as percentage of all musting personnel at national level.

Nursing rate at https://documents.org/sizes/personnel/sizes/person

Country groupings (tercities)

Low

Medium Number

Medium high

Medium high

Medium high

Medium high

Note. For each indicator, course and wided into five groups of roughly eagle state. The intention is not to suggest thresholds or target values to it in the indicator, but to allow a crude visual assessment of a country's performance relative to others'.

For example, a country' hat is in the top quantitie group in an indicator performance relative to others'.

For example, a country' hat is in the top quantitie group in an indicator performance relative to others'.

Old-age persion respirates (female) is an exception—countries are divided into three groups. Rankings are not provided in the disablocust. There is no index of safe space, balanced care work and agency that can be used for unique ordering or ranking of the countries.

Details on the Human Development Index Ranking and the Gender Inequality Index see Human Development Report 2019 Statistical Annex at http://dut.undp.orgien/data.
